Hogs and Pigs

National
Agricultural
Statistics
Service

United States
Department of
Agriculture

Washington, D.C.

Released September 27, 1991, by the Agricultural Statistics Board. Estimates refer to September 1 and June-August 1991.

Hog Inventory Up 6 Percent

U.S. inventory of all hogs and pigs on September 1, 1991, is estimated at 59.3 million head. This is a 6 percent increase from last year and 3 percent above September 1, 1989.

Breeding inventory, at 7.27 million head, was up 7 percent from a year ago and 6 percent above September 1, 1989.

Market hog inventory, at 52.0 million head, increased 6 percent from a year ago and was up 3 percent from September 1, 1989.

The 16 quarterly States, with an inventory of 53.9 million on September 1, 1991, were up 6 percent from last year and 3 percent above September 1, 1989. These 16 states accounted for approximately 91 percent of the total U.S. hog and pig inventory.

The June-August 1991 U.S. pig crop was 24.5 million head, 8 percent more than last year and up 6 percent from the same period in 1989. Sows farrowing during this period totaled 3.11 million head, up 8 percent from last year and 4 percent above 1989. Pigs saved per litter were 7.88 compared to 7.90 during the same period in 1990.

In the 16 quarterly States, the June-August pig crop was 22.2 million head, up 8 percent from last year and up 6 percent from two years ago. There were 2.82 million sows that farrowed during June-August, up 8 percent from a year earlier. Sows farrowing during June-August 1991 in the 16 States averaged 7.88 pigs per litter, compared to 7.89 during the comparable period a year ago.

U.S. producers intend to have 3.07 million sows farrow during the September-November quarter, 8 percent more than the actual farrowings during the same period last year and 10 percent more than in 1989. Farrowings intended for December 1991-February 1992, at 2.90 million sows, are 7 percent above 1991 and up 12 percent from 1990.

Intentions in the 16 quarterly States for September-November for sows farrowing are 2.80 million head, up 9 percent from the corresponding period last year and 10 percent above two years ago. December 1991-February 1992 intended farrowings, at 2.63 million head are up 8 percent from a year earlier and 12 percent more than in 1990.

1/ Number of pigs born September-November that were still on hand December 1 or had been sold.

2/ Intentions.

3/ Individual State estimates not available for the 34 other States.

Reliability of September 1 Hogs and Pigs Estimates

Survey Procedures: Primary data used to determine these estimates were obtained from a sample of producers from across the U.S. using probability surveys. These procedures ensure that all hog and pig producers, regardless of size, had a chance being included in the survey. Data were collected from about 70,000 operators sampled from a list of producers and from operators of 8,000 small land area tracts. Information was collected during the first half of September by mail, telephone, and face-to-face personal interviews. Regardless of when operators responded, they were asked to report inventories as of September 1.

Estimation Procedures: These hog and pig estimates were prepared by the Agricultural Statistics Board. National and State survey data were reviewed for reasonableness with each other and with historical estimates. In addition, a balance sheet was constructed to provide a check on the estimates. The balance sheet contains estimates of inventory, births and deaths and administrative data on slaughter, imports and exports.

Revision Policy: Revisions to historic estimates are made to improve quarter to quarter relationships of estimates such as market hogs and pig crop or relationships with slaughter. Estimates for the previous quarter are subject to revision when current estimates are made. In September, estimates for the previous June are reviewed and estimates for all quarters for the previous two years are reviewed in December. These reviews are primarily based on hog check-off receipts and livestock slaughter. Estimates will also be reviewed after data for the five-year Census of Agriculture conducted by the Department of Commerce are available. No revisions will be made after that date.

Reliability: Since all operations raising hogs are not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by relative standard error, is approximately 1.9 percent at the U.S. level for hog inventory. This means that chances are approximately 95 out of 100 that survey estimates for hog inventory will be within plus or minus 3.8 percent of the value that could be developed by averaging the estimates produced from all possible samples drawn from the same population and surveyed using the same procedures. The relative standard errors for estimates of major groupings of market and breeding hogs were 2.0 and 2.4 percent, respectively. The relative standard error for the individual market hog weight groups ranged from 2.3 to 2.7 percent. The sampling variability of survey estimates of intended farrowings is slightly larger than that for inventory estimates. More importantly, actual farrowings may differ significantly from intentions due to changes in economic and environmental conditions.

Survey estimates are also subject to non-sampling errors such as omissions, duplications, and mistakes in reporting, recording, and processing the data. These errors cannot be measured directly, but are minimized through rigid quality controls in the data collection process and a careful review of all reported data for consistency and reasonableness.

To assist users in evaluating the reliability of estimates in this report, a statistical measure based on past performance, the "Root Mean Square Error" is shown for selected items. It is computed by expressing the deviations between the initial estimates and the final estimates as a percent of the final estimates and averaging the squared deviations for the last 10 quarters; the square root of this average is the "Root Mean Square Error". Probability statements can be made concerning expected differences in the current estimates and the final estimates, assuming factors affecting this year's estimates are not different from those influencing recent years. The "Root Mean Square Error" for the hog inventory estimates is 0.9 percent. This means that chances are 2 out of 3 that the final estimate will not be above or below the current estimate of 59,300,000 head by more than 0.9 percent or about 533,700 head. Chances are 9 out of 10 (90 percent confidence level) that the difference will not exceed 1.7 percent or about 1,008,000 head.

Also shown in the table is a 10 quarter record for items showing the range of differences between the first inventory estimate and the final estimate. Using estimates for all hogs as an example, changes between the first inventory estimate and the final estimate during the past 10 quarters have averaged 137,000 head, ranging from 31,000 to 1,130,000 head. The inventory estimate has been below the final estimate 4 times and above 6 times in the last 10 quarters. This does not imply that the September 1 estimate this year is likely to understate or overstate final inventory. For most items, the number of quarters the initial estimates have been below or above the final estimate is about equally distributed.
